Space division  
Partitioning walls

# Open and shielded

Open, networked, mobile: the future of work is dynamic. This dynamism requires new space concepts. Group and open plan offices promote teamwork and collaboration. Zones that flow into and merge with each other can be used individually or in cooperation with other colleagues. At the same time, retreat options for such purposes as brief discussions or undisturbed calls are indispensable in open plan offices. Future-oriented office design therefore simultaneously promotes concentration, communication, inspiration and recreation.

Accordingly, these open, flexible structures require systems that bring structure whilst providing visual and acoustic shielding. ophelis fulfils these requirements with the paravento and paravento hub space division systems. The textile nature of the system creates a pleasant atmosphere at the same time. The tangens and tangens loft partitioning systems partition spaces, form rooms and think tanks, and create work environments that give employees and companies individual space for development.

We would like to thank our strategic manufacturing partners Zeitraum Möbel, kvadrat with Kinnasand and Danskina, camira Fabrics, Foscarini, Hatec Leuchten, louis poulsen, Dauphin/Züco, Wilkhahn, and Object Carpet for their kind support.

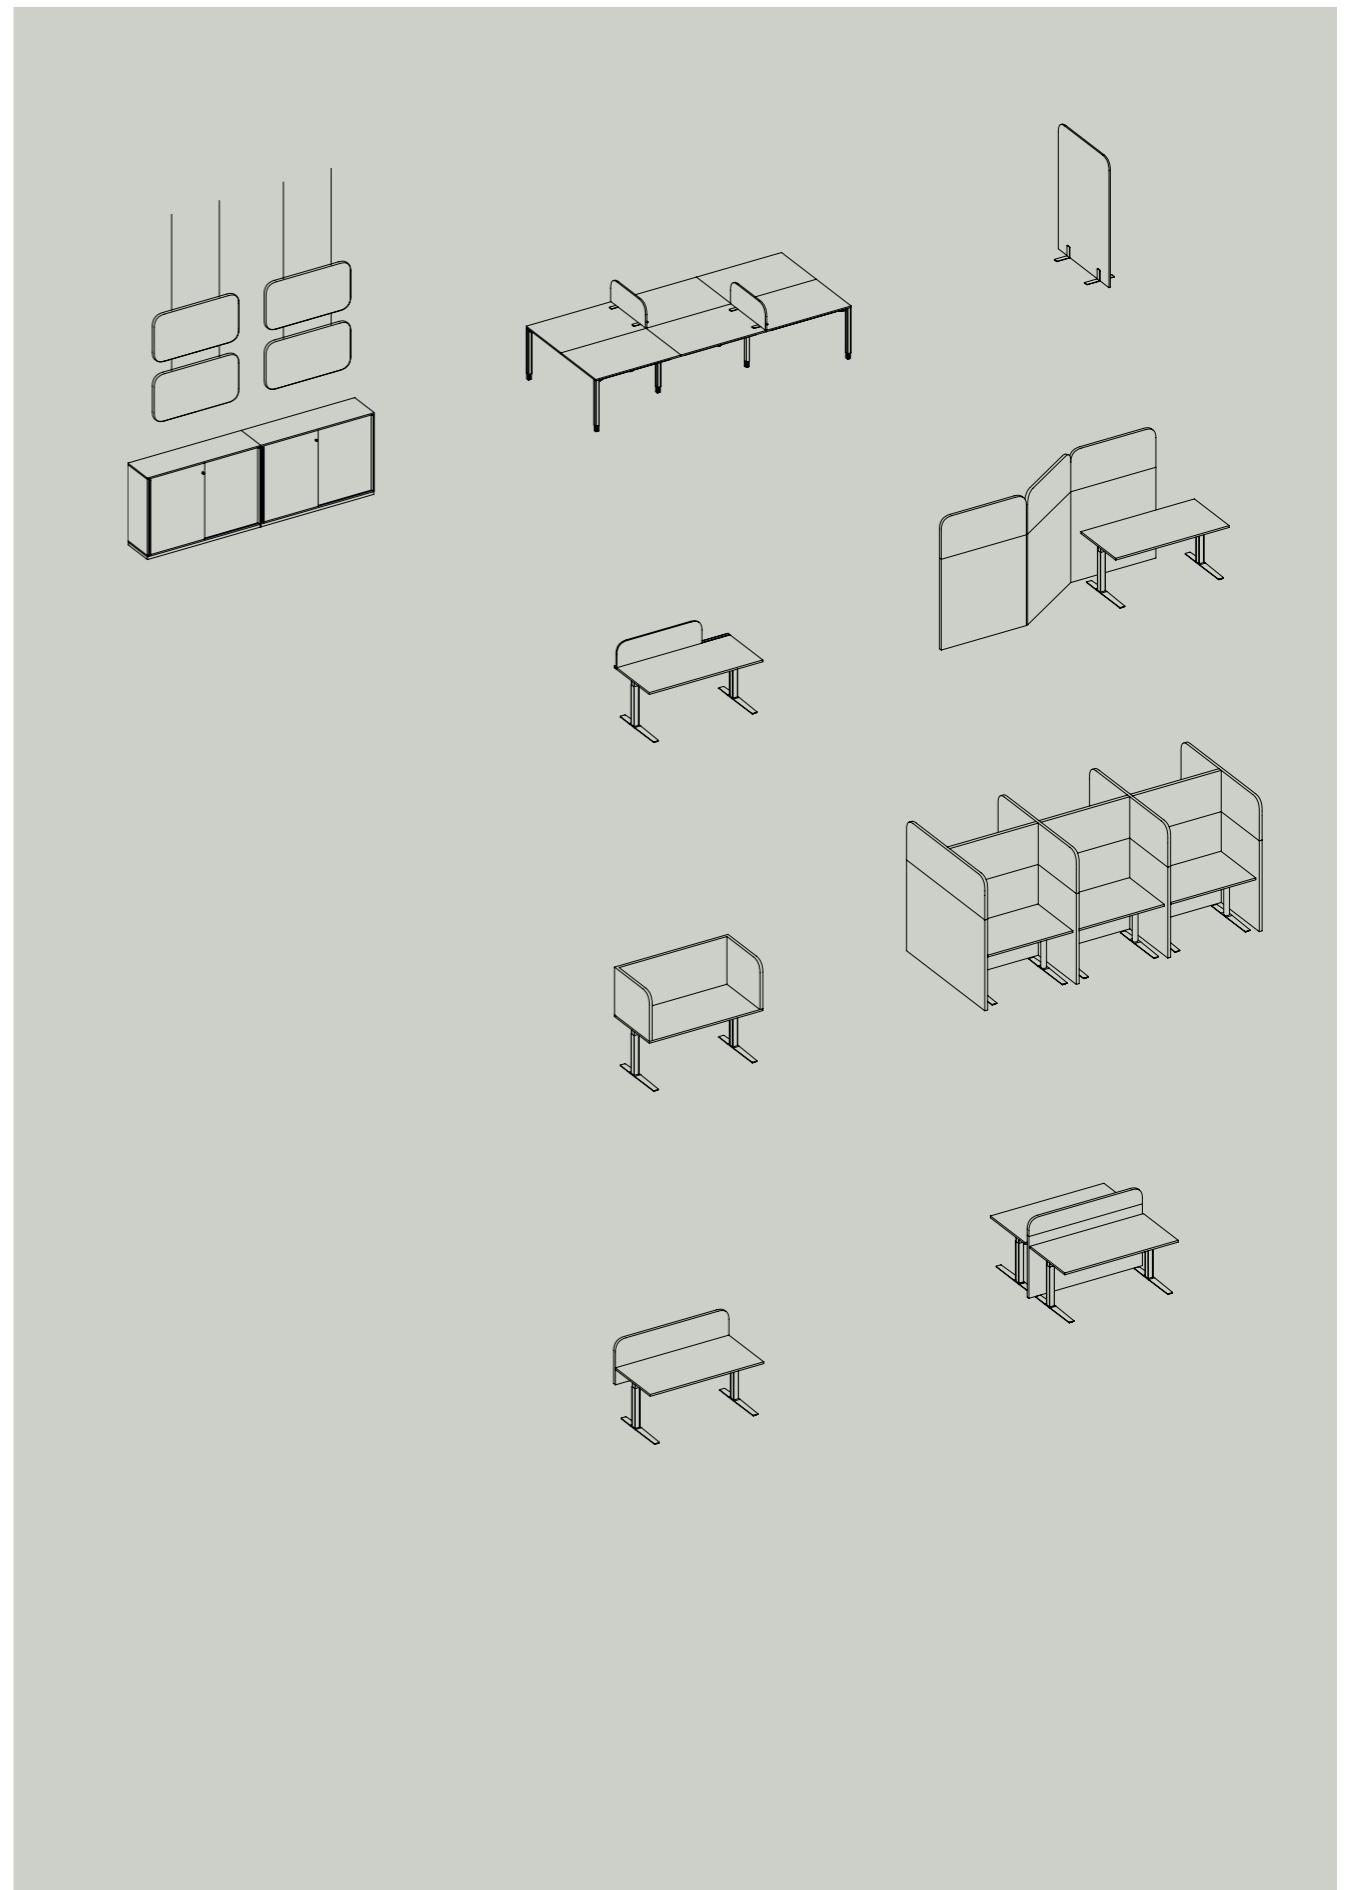

# paravento

The paravento space division system from ophelis offers various options for creating excellent working environments. paravento's unique selling point is the fusion of high technical functionality and a cosy look and feel.

The system acts as a visual link between the areas of communication, work and relaxation. With its wide variety of options for visual and acoustic shielding, it addresses the need for spaces of relaxation even in open-plan areas.

paravento may stand freely in a space and – as the paravento screen – can also be used at a table. paravento is available in two different thicknesses, S and M. S (slim) is exclusively for visual shielding, while M (medium) is acoustically effective and organisational. The system can be enhanced with paravento air (ceiling-mounted) and paravento wall (wall-mounted), and the freestanding paravento hub modules.

paravento creates a pleasant open-plan setting and fits into other areas of the office with its unique style and material appearance.

S series sliding door cabinet, accessible from both sides

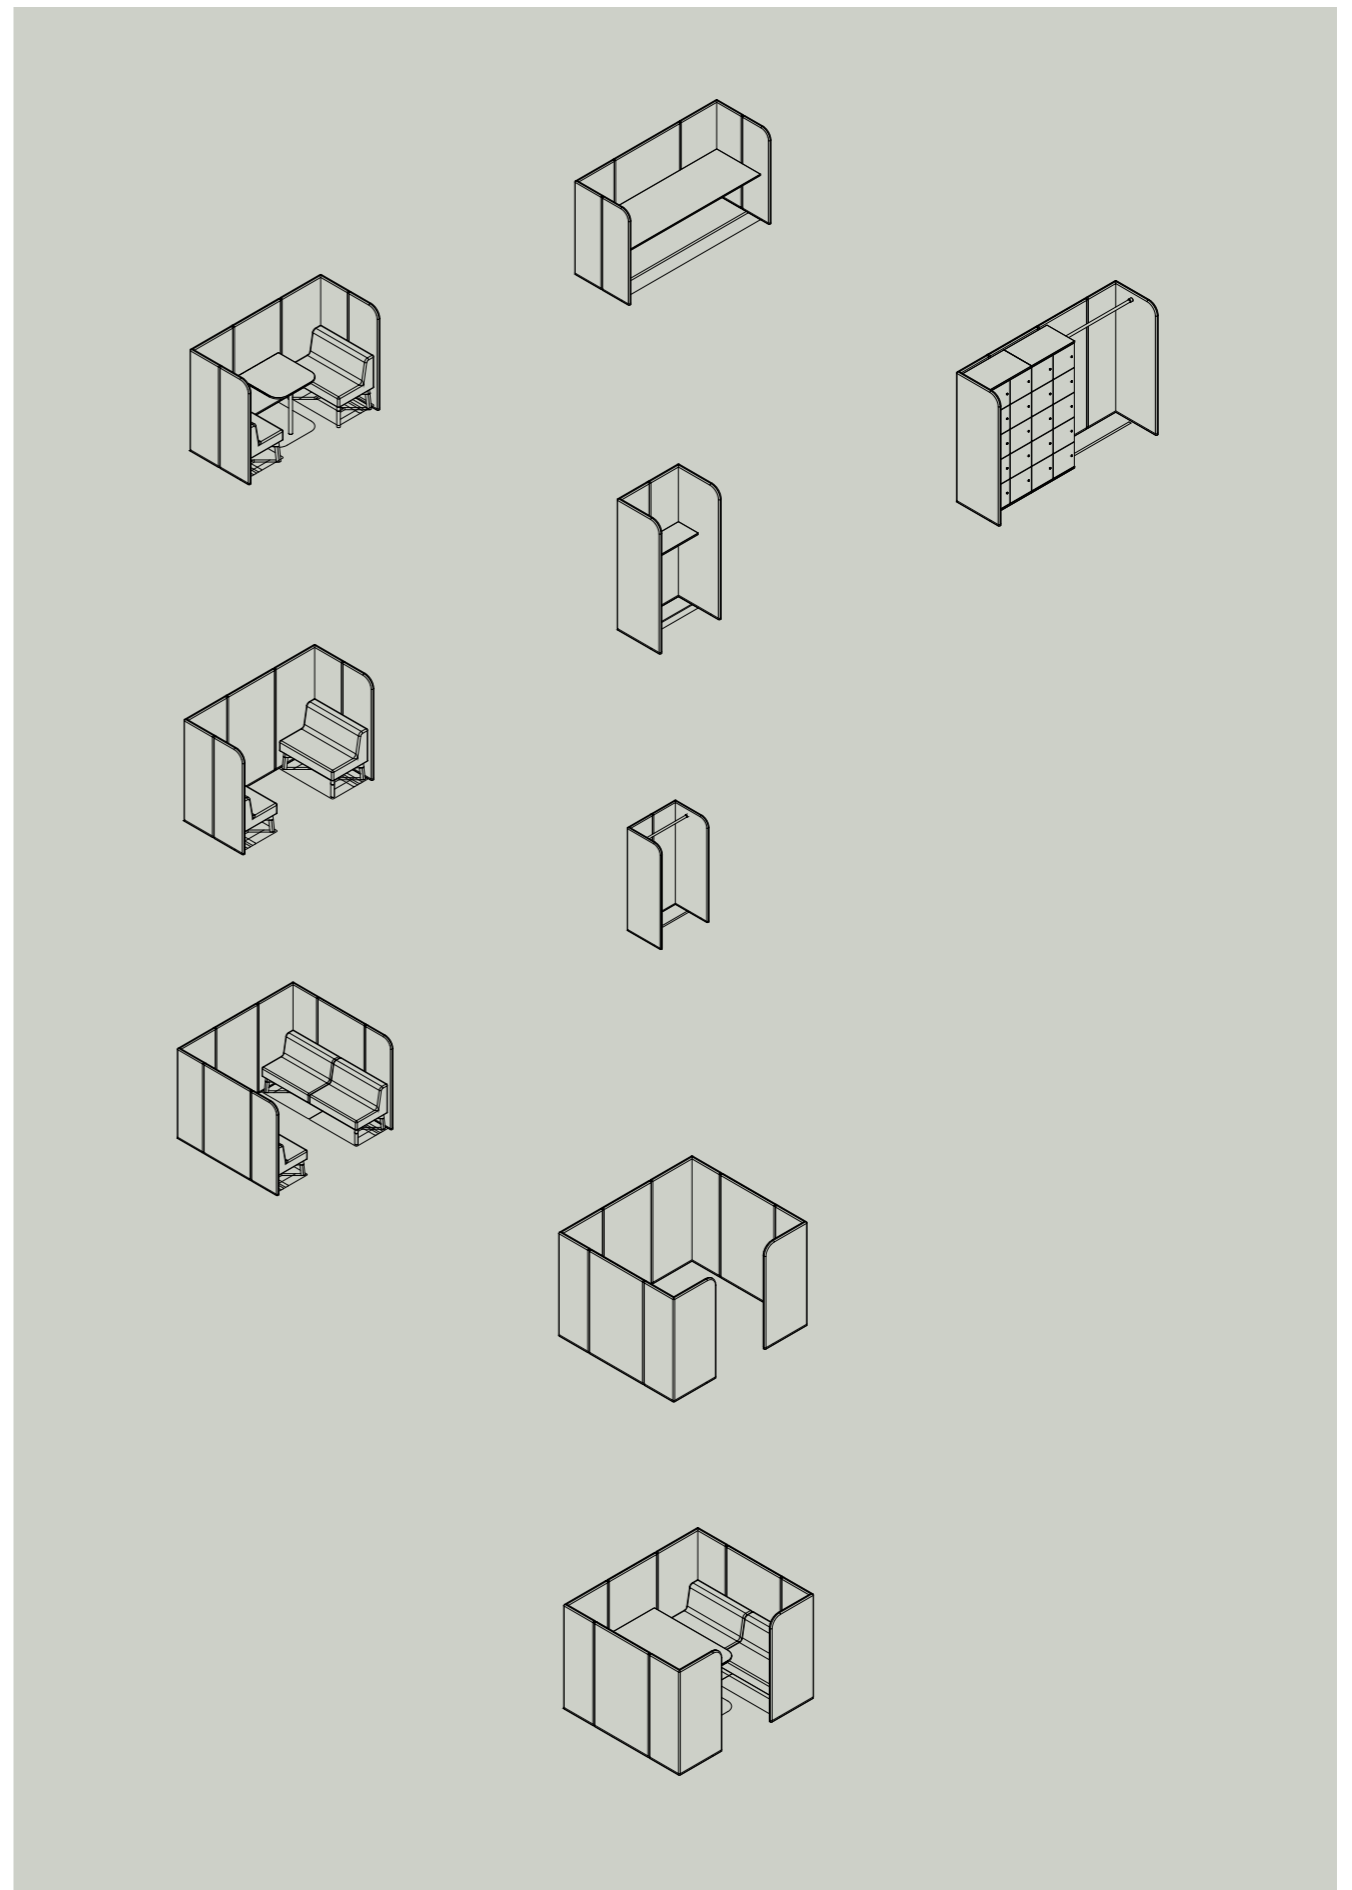

# paravento hub

With paravento hub, zones can be formed for different purposes within open-plan areas. The modules function as think tanks, meeting areas, phone booths, wardrobes or service points. paravento hub takes into account the soundproofing that is necessary in open-plan spaces – inwards and outwards.

The paravento hub modules enable open space to be split into areas for specific functions, while at the same time creating a productive and pleasant working environment. When combined with ophelis docks, the hub modules form a two or four-seater compartment including a table for meetings.

1: Electrification  
2: Lighting

The dimensions of the paravento space division system have been adapted to the ophelis storage space solutions as well as the various work desk systems. The unrestricted compatibility of the individual modules allows the space to be used in many ways. The large selection of textiles and colours offers the highest degree of creative freedom.

paravento comes in the Basic version or in the Premium Acoustics version, for even more sound reduction and undisturbed working in open structures.

paravento hubs can be supplied with power and equipped with lighting.

3

A concealed organisation rail in the paravento M enables third level organisation of the work desk, thus creating more free space. Additional accessories such as storage compartments, pen trays or media panels are available.

# tangens und tangens loft

The tangens partition wall system adapts to new users and uses as well as to the building's architecture. Office and meeting spaces, think tanks or break areas that are perfectly adapted to the working environment emerge with the room-in-room system.

tangens meets the structural requirements for preventative fire protection. The foundation of tangens is a supporting aluminium outer frame with prefabricated double-shell partitioning elements that can be attached with a click-and-lock system. This construction enables structures with a height of up to six metres.

Whether round or square, glass on glass, made of solid material or cloth: tangens opens the door for many design possibilities, both vertically and horizontally. Moreover, tangens loft offers a particularly exceptional design: in the all-glass, single-leaf system, only the narrow top and bottom profiles are visible.

Numerous accessories as well as universal electrification options expand the design scope even further. For an integrated spatial effect, tangens is compatible with both ophelis wall unit systems and the S series furniture.

About tangens and tangens loft

Various types of doors made of wood and glass, as well as revolving and sliding doors allow the space to be adapted to specific needs.

Reduced profile thickness provides an elegant appearance. Sophisticated connections to the floor, wall and ceiling create perfect transitions. What's more, materials such as wood, glass and textile-covered pinboard elements combine seamlessly.
